P_3 -separator

Definition

The *blocks of decomposition* of G with respect to a proper P_3 -separator are the two graphs $G_X = G[X \cup acb \cup Q]$ and $G_Y = G[P \cup acb \cup Y]$ where P is an aXb -path with no internal vertex adjacent to c , and Q is any aYb -path.

Lemma

G is a non-basic $(\theta, \text{triangle}, \text{wac})$ -free graph if and only if its blocks of decomposition are $(\theta, \text{triangle}, \text{wac})$ -free.

Decomposition tree

Definition

- Given G , T_G is a rooted tree, and its root is G itself.
- If $H \in V(T_G)$ has some clique separator, then for a minimal clique separator K , the children of H are the blocks of decomposition of H with respect to K .
- Similar for proper 2-separator and proper P_3 -separator.
