Dense cycles

Cyclic minor

Concluding
remarks

High minimum degree implies:

- a highly connected subgraph [Mader, 1972];
- a large clique as a minor [Kostochka, 1982; de la Vega, 1983];
- a large clique as a topological minor [Bollobás and Thomason, 1998];
- a large biclique as a subgraph or a subdivision of some prescribed graph as an induced subgraph [Kuhn and Osthus, 2004];
- a k -linked subgraph [Thomas and Wollan, 2005].

New (at least unknown) results

Cyclic clique
minors

Beatriz M.

Preliminaries

Dense cycles

Cyclic minor

Concluding
remarks

- Cycle C with high number of chords
[Gupta, Kahn and Robertson, 1980];
Moreover, contracting edges of C yields a graph with high
minimum degree.

Dense cycles

Cyclic minor

Concluding
remarks

- Cycle C with high number of chords
[Gupta, Kahn and Robertson, 1980];
Moreover, contracting edges of C yields a graph with high minimum degree.
- A large clique as a cyclic minor.

What is a lollipop?

Definition

A *lollipop* $L = (P, C)$ in a graph G is a pair where $P = p_1 \dots p_s$ ($s \geq 1$) is a path of G , $C = c_1 \dots c_t c_1$ ($t \geq 3$) is a cycle of G , $p_s = c_1$ and $V(P) \cap V(C) = \{c_1\}$;

What is a lollipop?

Definition

A *lollipop* $L = (P, C)$ in a graph G is a pair where $P = p_1 \dots p_s$ ($s \geq 1$) is a path of G , $C = c_1 \dots c_t c_1$ ($t \geq 3$) is a cycle of G , $p_s = c_1$ and $V(P) \cap V(C) = \{c_1\}$;

Figure: Two representations of a lollipop L .

Definition

A lollipop L is *optimal* if:

- L is vertex-wise maximal and
- among all lollipops on $V(L)$, L has a cycle of maximum length.

Hamiltonian paths

Cyclic clique
minors

Beatriz M.

Preliminaries

Dense cycles

Cyclic minor

Concluding
remarks

From now on we consider an optimal lollipop in a graph with minimum degree at least k .

Lemma

If $G[C]$ contains a Hamiltonian path with ends c_1 and u , then $N_G(u) \subseteq V(C)$.

Dense cycles

Cyclic minor

Concluding
remarks

Active paths

Definition

- $\mathcal{S}_1 = \{c_1 c_2 \dots c_t, c_1 c_t c_{t-1} \dots c_2\}$.
- For all $i \geq 1$, define \mathcal{S}_{i+1} from \mathcal{S}_i .

Figure: Construction of an element of \mathcal{S}_{i+1} from an element of \mathcal{S}_i .

Active paths

Definition

- An *active path* is any path Q from some \mathcal{S}_i ;

Figure: Construction of an element of \mathcal{S}_{i+1} from an element of \mathcal{S}_i .

Active paths

Definition

- An *active path* is any path Q from some \mathcal{S}_i ;
- By extension, we also call *active vertex* every vertex $u \neq c_1$ that is an end of an active path.

Figure: Construction of an element of \mathcal{S}_{i+1} from an element of \mathcal{S}_i .

Active paths

Definition

- An *active path* is any path Q from some \mathcal{S}_i ;
- By extension, we also call *active vertex* every vertex $u \neq c_1$ that is an end of an active path.

Definition

An edge of C whose both ends are non-active is *passive*.

Figure: Construction of an element of \mathcal{S}_{i+1} from an element of \mathcal{S}_i .

Active vertices

Cyclic clique
minors

Beatriz M.

Preliminaries

Dense cycles

Cyclic minor

Concluding
remarks

Lemma

C contains at least k active vertices. Moreover, if $d_C(c_1) < k$, then C contains at least $k + 1$ active vertices.

Active vertices

Cyclic clique
minors

Beatriz M.

Preliminaries

Dense cycles

Cyclic minor

Concluding
remarks

Lemma

C contains at least k active vertices. Moreover, if $d_C(c_1) < k$, then C contains at least $k + 1$ active vertices.

Theorem [Gupta, Kahn and Robertson, 1980]

C contains at least $k + 1$ vertices of degree at least k (in C).
In particular, C has at least $\frac{(k+1)(k-2)}{2}$ chords.

Lemma

If R is a subpath of C containing only passive edges and u is an active vertex, then u has at most one neighbor in R .
Moreover, such a neighbor is an end of R .

Theorem

There exist sets $X_1, X_2 \subseteq E(C)$ so that for $i \in \{1, 2\}$, the graph G_i obtained by deleting all vertices not in C and contracting the edges of X_i has at least k vertices and

- minimum degree at least $\lceil \frac{k+2}{2} \rceil$ if $i = 1$, and
- average degree at least $\frac{2}{3}(k + 1)$ if $i = 2$.

K_4 and K_5 as a cyclic minor

Cyclic clique
minors

Beatriz M.

Preliminaries

Dense cycles

Cyclic minor

Concluding
remarks

Lemma

Let C be a Hamiltonian cycle of a graph F . If F has minimum degree at least 3, then we can contract edges of C to obtain K_4 . If F has average degree at least 6, then we can contract edges of C to obtain K_5 .
